chemical analysis moves from laboratory to places where samples to be analysed are located

this trend is aptly termed on site analysis as the dictum says from sample transfer to information transfer owing to the ever increasing number of samples to be analysed preliminary screening and selection of samples seems to be necessary even in the laboratory rapid test methods of chemical analysis can solve both these tasks this book is devoted to test methods that are widely used in environmental industrial clinical forensic medical and other areas allowing a rapid simple and cost effective analysis qualitative semi quantitative and quantitative to be performed by trained as well as non trained personnel some general characteristic features of test methods and test systems are described in the book e g definitions advantages and limitations chemical and physical principles of operation procedures and protocols and methodological aspects application of test methods in various areas is extensively overviewed and the test means and test tools pertinent for solving each concrete analytical task are discussed e g paper strips indicator powders and tubes tablets etc the most important applications of test methods evidently are testing for inorganic and organic components in water mostly for purposes of environmental control monitoring of toxic gases and alcohol vapours detection of narcotics and explosives determination of glucose cholesterol and other components of medical importance

a working definition of the discipline of chemical ecology might be the study of the structure function origin and significance of naturally occurring compounds that mediate inter and intraspecific interactions between organisms in particular chemical ecology focuses on determining the role of semiochemicals and related compounds in their natural contexts thus chemical ecology is distinct from disciplines such as pharmacology in which compounds are screened for uses outside their natural context for example in the screening of natural products for use as drugs superficially many of the methods used in the various branches of natural products chemistry such as pharmacology and chemical ecology are very similar but each branch has developed its own set of specialized methods for dealing with the problems characteristic of that discipline for example in chemical ecology many semiochemicals are isolated and identified using only a few micrograms or less of material although the same general chromatographic and spectroscopic techniques are used as would be used with the identification of most organic compounds specialized techniques have been developed for handling these very small quantities allowing the maximum amount of information to be recovered from the minimum amount of sample these micro scale techniques and the problems unique to working with very small amounts of sample are rarely covered in detail in reference books on the isolation and identification of biologically active natural chemicals

excerpt from methods of chemical analysis and foundry chemistry the first five methods for the determination of iron phosphorus manganese calcium and sulphur all de pend upon the use of a standard solution of potassium permanganate for which reason i call them a family of methods in my experience the solution of permanganate is more easily standardized than any other solution em ployed in this class of work it is the basis of a large number of volumetric methods the permanence of a standard solution of potassium permanganate is made evident by the following data about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks com this book is a
